

Document Module - Upload & Retrieval Flow

This flowchart describes the process of uploading and retrieving documents in the HRMS Document Module.

Upload Flow:

1. User (Employee/HR) uploads a document through the Upload API.
2. DocumentService handles the file.
3. Based on storageType, the file is stored in Local Storage or Cloud Storage (S3/Azure/GCP).
4. Metadata (filePath, storageType, etc.) is saved in the Database.

Retrieval Flow:

1. User requests a document via the Download API.
2. API fetches metadata from the Database.
3. If Local Storage → returns file.
4. If Cloud Storage → generates pre-signed URL / redirect.
